Specificity is key when training athletes, and many times this is overlooked by different training programs. It has been my experience that in the strength training community General Physical Preparedness (GPP) is the foundation for all levels. Note that nothing we do in the weight room is sport specific, it is merely training the body to move correctly on the field of play. Mike Boyle advances with functional training for sports. Boyle Template. (Juan Carlos Santana) - Functional Training - 1st Edition (2016). Functional training is best described as a continuum of exercises that teach athletes to handle their own body weight in all planes of movement. Experts emphasize that functional training trains movements, not muscles. There is no emphasis on overdeveloping strength in a particular movement; instead, emphasis is on attaining a balance between pushing and pulling strength and between knee-dominant hip extension (quadriceps and gluteals) and hip-dominant hip extension (hamstrings and gluteals).
Functional Training for Sports. on multijoint movement as much as possible. Vern Gambetta and Gary Gray, two recognized experts on functional training, state, “Single joint movements that isolate a specific muscle are very non functional.”

Functional Training for Sports. athlete is by definition performing open-chain muscle action. Open-chain means that. Train to perform at the highest level with the lowest risk of injury. New Functional Training for Sports, Second Edition produces the best results on the court, field, track, and mat, not just in the weight room. Michael Boyle, one of the world’s leading sport performance coaches, presents the concepts, methods, exercises, and programs that maximize athletes’ movements in training to perform at the highest level with the lowest risk of injury.

Having been in the strength and conditioning field for over 30 years, Boyle has worked with athletes from all sports, but most noticeably hockey. This experience has given Boyle insight that can be applied to training programs by other coaches who haven’t been so privileged. This meant that a functional training program for sport was the same thing as a strength and conditioning program for that same sport, and each would obviously differ according to the requirements of that sport. Equally, there was no such thing as one single functional training program, any more than there was such thing as a single strength and conditioning program that would suit athletes of all sports. Might even somehow put the athlete at risk of injury. To my knowledge, no evidence of either of these things ever occurring has ever been produced. In any event, any framework of strength training that ignores many of the ways in which strength is specific (like this modern form of functional training) will ultimately fail to prepare athletes optimally for sport.
